

## **SECURITY INCIDENT REPORT — ARCHIVE COPY**

Overtime hours increased dramatically during the final week.

Ventilation systems in several rooms registered unusual heat spikes.

Engineers assumed it was a faulty power supply at first.

Reports mentioned a laptop left plugged in overnight without supervision.

Heat signatures appeared near charging stations across multiple floors.

Employees dismissed it as normal workload pressure.

A sudden shutdown occurred moments before the incident.

Technicians later discovered melted insulation near a cable.

Energy logs suggested excessive power draw from a single port.

Data analysts noticed voltage irregularities repeating every few minutes.

Game development staff joked about high-performance chargers overheating.

All surveillance cameras failed briefly during the spike.

Monitoring systems attempted automatic resets but failed.

Investigators suspected a device drawing more current than expected.

Network traces showed brief disconnections near workstations.

Go to the bottom of document for whitewashed clue from the murderer.

Late at night, someone moved between floors carrying equipment.

A faint burning smell was reported by night security.

Power fluctuations confused the monitoring software temporarily.

Technicians reviewed footage but found only blurred shadows.

Overload warnings appeared shortly before the system failure.

Put the fries in the bag.
